

Notes:

- When administering a drug / making an observation, ER diagram doesn't enforce that the patient is infected (as the diagram is for all dates, but a patient can be infected on one date and recovered on another)
- Can not enforce that we get the name + phone or name + email of a possibly infected person
- Hassymptoms is meant for the same pid, as in a person has symptoms, goes to get tested, becomes a patient. It is enforced in the CREATE TABLE, but not in the diagram
